

ABSTRACT OF THE DISCLOSURE

There is disclosed an image processing apparatus in which a system control circuit (50) monitors the power source voltage when data write access to a recording medium (200) occurs, and cuts off power supply to an image display unit (28) when the power source voltage becomes smaller than a predetermined value L2, so as to reduce write errors of data to be written resulting from a power source voltage drop, a control method of the image processing apparatus, and a storage medium.
